

Weidong Zhu

PhD Student, University of Florida

Personal Information

Address: 601 Gale Lemerand Dr, Gainesville, FL, 32603

My Github: <https://github.com/zwdong1994>

Web: <https://www.cise.ufl.edu/~weidong/>

Phone: +1-352-328-1228

Email: weidong.zhu@ufl.edu

Education

2019 - Now	PhD student, Computer Science, Department of Computer & Information & Science & Engineering University of Florida, US
2016 - 2019	M.S., Computer Science and Technology, School of Information Science and Engineering Xiamen University, China
2012 - 2016	B.E., Information Security, School of Computer Science and Technology Huazhong University of Science and Technology, China

Research Interests

Areas: Security of Computer System

Focus: Storage Security, Trustworthy Computing, Mobile Security

Conference Publications

- Weidong Zhu, Grant Hernandez, Washington Garcia, Hunter Searle, Joseph Choi, and Kevin R. B. Butler. **In submission.** 2020.
- Suzhen Wu, Jindong Zhou, Weidong Zhu, Hong Jiang, Zhijie Huang, Zhirong Shen, and Bo Mao. **EaD: a Collision-free and High Performance ECC assisted Deduplication Scheme for Flash Storage.** In Proceedings of the 38th IEEE International Conference on Computer Design (ICCD 20). 2020.
- Suzhen Wu, Weidong Zhu, Guixin Liu, Hong Jiang, and Bo Mao. **GC-aware Request Steering with Improved Performance and Reliability for SSD-based RAIDs.** In Proceedings of the 32nd IEEE International Parallel & Distributed Processing Symposium (IPDPS 18). Vancouver, British Columbia, Canada, May 21-May 25, 2018.

Journal Publications

- Suzhen Wu, Weidong Zhu, Yingxin Han, Hong Jiang, Bo Mao, Zhijie Huang, and Liang Chen. **GC-Steering: GC-aware Request Steering and Parallel Reconstruction Optimizations for SSD-based RAIDs.** IEEE Transactions on Computer-Aided Design of Integrated Circuits and Systems (TCAD), doi: 10.1109/TCAD.2020.2974346, 2020.
- Suzhen Wu, Weidong Zhu, Bo Mao, Kuan-Ching Li. **PP: Popularity-based Proactive Data Recovery for HDFS RAID Systems.** Future Generation Computer Systems. 86: 1146-1153, September 2018.

Research & Experience

Research Assistant
FICS, University of Florida

Advisor: Dr. Kevin R. B. Butler July 2019 - Now

- **Ransomware Defending**

Ransomware encrypts victim data and extorts for financial reward and thus leads to millions dollar damage every year. And the state-of-the-art schemes for defending ransomware are easily compromised by privileged ransomware that could disable the defending mechanisms in the userspace and kernel. Flash-based storage device has intrinsic isolation from operating system and could perform out-of-place-update that could be used for detection and backup. Therefore, how to exploit storage for defending ransomware is an promising and interesting topic.

Research Assistant
Advanced Storage Technology Lab, Xiamen University

Advisor: Dr. Suzhen Wu July 2016 - June 2019

- **KV-based Stores**

CockroachDB is a distributed SQL database built on a transactional and strongly-consistent key-value store. And CockroachDB uses RocksDB as its key-value store engine. However, in the CockroachDB, there are some CPU-consuming functions and operations like SELECT, encoding, are locate at the place where is far away from the storage level. So, the length of IO path is too long that will cause more writes and reads in order to transfer the data from the storage layer to the CockroachDB. Therefore, I modified the code of CockroachDB to move the CPU-consuming functions to the storage layer (RocksDB), which is called CRDB-Near.

- **Deduplication**

Deduplication can significantly reduce write traffic and it has great profit for flash-based storage system, like SSD RAID. So, deduplication can help to improve the performance and reliability in the flash storage system. Moreover, with the advent of NVMe and 3D NAND flash technologies, the performance of flash-based storage systems has been improved significantly. Therefore, this brought a new problem that the hash operation might become the bottleneck in the deduplication systems. So, I proceeded my research with this direction.

- **SSD-based Array**

SSD-based RAIDs suffer from significant performance degradation whenever user I/O requests conflict with the ongoing Garbage Collection (GC) operations which introduces tail latency. And it will also brought great tail latency in the SSD-based Array. Moreover, the uncorrectable error occurred of SSD in the SSD-based RAIDs will trigger the fail-recovery process. So, proposing a scheme that aware of the GC process within an SSD-based RAID, to address both the performance and reliability issues of SSD-based RAIDs alluded to above is our main target in this research project.

Join a Competition
Information Security Lab, Huazhong University of Science and Technology

2014 - 2015

- **An USB-based Device with Encryption**

To ensure the security of USB-based device, encryption or the other security technology used on the USB-based device. However, existing schemes were always built in the software layer and its access control function is not perfect. So, we built a security system with USB-based device by using AES algorithm to encrypt the data and provided a strong access control system on the PC. Besides, the encryption system built on the firmware of the USB-based device.

Honors & Awards

IPDPS'18 Student Grant	May 2018
Excellent Merit Student, Xiamen University, China	Nov. 2017
National Scholarship, Ministry of Education of China	Oct. 2017
Third Price of 2015 National College Students Information Security Contest, Ministry of Education of China	Aug. 2015

Computer Skills

Operating System:	Linux, Windows, MacOS
Database:	Leveldb, RocksDB, CockroachDB
Programming:	C, C++, GO, Python, L ^A T _E X
